

Lawnporn's Beetle/Grub Recovery Guide

One of the common questions we get is to do with lawn grubs/Beetle. I could go into how they are in your lawn and their life cycle but this can all be easily found after some searching on the internet. To assist we have decided to make a quick how-to guide for treating a lawn which has these or perhaps helping to recover after being treated. We have recommended products we use that are readily available from most hardware stores for a reasonable cost. Grub/beetle product could be substituted for a different product but please apply as per directions and adjust the fertiliser schedule accordingly. Yes you can get stronger products that last longer and would be better, however these can be hard to come by and are often expensive.

This is a guide only and may have varied results depending on weather, location and many other factors. So please adjust accordingly.

Week 1 – Apply Amgrow Patrol Beetle & Grub killer as per Instructions on container. Remember to water in for approx. 10 mins to allow the chemical to release from the granules.

Week 2 – Apply Lawnporn Launch+. Full strength is 100ml per 100sqm, if this is the first time using Launch+, use a lower application rate such as 60ml per 100sqm and build up each application to full strength. Allow at least 6-12 hours before any water (incl rain) to allow the product to be absorbed. This is a great all round repair fertiliser that can be used in conjunction with a slow release fertiliser.

Week 3 – Apply Lawnporn 4 seasons slow release fertiliser per instructions on packet. This will help with the ongoing repair and supplement the nutrients the plant is getting during launch+ applications.

Week 4 - 2nd application on Amgrow Patrol Beetle & Grub killer as per Instructions on container. Remember to water in for approx. 10 mins to allow the chemical to release from the granules.

Week 5 – Apply Lawnporn Launch+. Full strength is 100ml per 100sqm. Allow at least 6-12 hours before any water (incl rain) to allow the product to be absorbed. This is a great all round repair fertiliser that can be used in conjunction with a slow release fertiliser.

Week 6 – Apply Lawnporn Moist wetting agent. Remembering to water in. This will help retain the moisture for the turf in the root zone. **note not all lawns may require this, so apply as required. We apply as best to be safe than sorry!

Week 7 – Apply Lawnporn Launch+. Full strength is 100ml per 100sqm. Allow at least 6-12 hours before any water (incl rain) to allow the product to be absorbed. This is a great all round repair fertiliser that can be used in conjunction with a slow release fertiliser.

Week 8 – 3rd application on Amgrow Patrol Beetle & Grub killer as per Instructions on container. Remember to water in for approx. 10 mins to allow the chemical to release from the granules.

Week 9 - Apply Lawnporn Launch+. Full strength is 100ml per 100sqm. Allow at least 6-12 hours before any water (incl rain) to allow the product to be absorbed. This is a great all round repair fertiliser that can be used in conjunction with a slow release fertiliser.

Ongoing – We recommend treating for grubs/beetles every 4 weeks to maintain a grub free lawn unless you are using a product with longer life. Your turf should be sufficiently recovered after this time to continue with your normal program. If your turf is still recovering, continue to use Launch+ Every 2 weeks until recovered.

From here on you can work with your lawn and manage growth and the look of your lawn by alternating between Launch+ and Greenlight. Continue to apply Moist monthly to assist in water retention and even spread of moisture throughout the root system. You can mix root build and greenlight in the same tank to maintain a stunning deep green while also feeding the root system.
